

FloraKleen

General Hydroponics Flora Kleen is a salt clearing solution that is unique in our industry. FloraKleen is formulated to remove fertilizer residues that can accumulate over time in hydroponic systems, growing media, and potting soils. It is safe for use in all systems and media while plants are growing. It can also be used between crops to clean the systems from accumulated salts. Unlike other products on the market, it is not enzyme based and uses a completely different technology.

FloraKleen can be used at any time throughout the plant life.

During cultivation, FloraKleen:

- Dissolves accumulated mineral salts.
- Reduces plant stress from excess and imbalanced nutrients.
- Breaks nutrient bonds that attach fertilizer salts to growing media, also correcting nutrient lock-out.
- Nourishes the microbial life in the substrate.

Use FloraKleen each time you purge your hydroponic system or potted plants from excess salts that can accumulate as a result of regular fertilizer application.

FloraKleen is also an excellent final flush:

- Use FloraKleen as a final flush a few days before harvest to terminate maturation and promote sugaring.
- Also use FloraKleen during the last one to two days before harvest.

Its high concentration and low price make FloraKleen the economical choice to protect g your plants in both hydroponics and soil based environment.

DIRECTIONS FOR USE:

In Hydroponic systems:

- **Between nutrient solution changes:** Mix 1,5 to 3 mL per liter of water. Use milder solution for young or fragile plants, stronger solution for older and stronger plants close to harvest. Circulate 48 hours with FloraKleen alone before adding nutrients.
- **Final flush before harvest:**
 1. Alone: Drain old nutrient solution and discard. Refill hydroponic reservoir with fresh water and mix 3 mL of FloraKleen per liter water. Run this solution during last day or two before harvest.
 2. After Ripen*: Add 3 mL of FloraKleen per liter water during the last 2 days before harvest to increase the sugar level in your crop.

In potting soil & soilless mixes:

1. Alone: Every fifteen days fill a watering can with fresh water and add 1,5 to 3 mL /L ForaNKleen. Drench until there is runoff from the bottom of the pot. Resume your regular fertilizer schedule with the next watering.
2. After Ripen*: Add 3 mL of FloraKleen per liter water during the last 2 days before harvest to increase the sugar level in your crop.

** NB. FloraKleen and Ripen are not antagonistic, but work together in perfect synergy.*
