

## Flora Series

**For all growing methods: hydroponics, soil less and soil  
ADVANCED NUTRIENT SYSTEM: The Original Formula**

The concept of a 3 parts nutrient, and Flora-series, were created for General Hydroponics by Dr. Cal Herrmann, formerly senior chemist at NASA, in collaboration with scientists from the University of Davis in California. Dr. Herrmann is, today, a partner at GHE and still conducts research.

Flora is a dynamic, evolving formula, constantly updated, and adapted to the latest scientific discoveries. Simply, it allows you to match the needs of your plant through its different stages by changing the ratios between the liquids, as well as their concentration.

Flora-series consists in 3 components:

**FloraGro** promotes a lush structural and foliar growth.

**FloraBloom** : During growth it increases root formation and health. During flowering and fruiting it enables the plant to fulfil its genetic potential to the maximum. *Of special importance for water culture growers, FloraGro and FloraBloom both contain silicate (in form of silicic acid) to complete the diet and strengthen the structure of your plants*

**FloraMicro** provides the plant with all the necessary micro-elements, in a chelated form. It includes also sub micro-elements, and organic buffers which help to stabilise the solution's pH. FloraMicro complements FloraGro and FloraBloom in secondary and major nutrients.

Between those three products there exists a synergy which creates the magic of the system.

*Flora Series exists in 0,5 l, 1 l, 5 l, 10 l, 60 l.*
