|----------------------|----------------|--------------------------|
| <b>.338 Dia.</b>     | <b>200 gr.</b> | <b>Sec. Density .250</b> |
| <b>FIV 1700-3200</b> |                | <b>Length 1 .172”</b>    |
| <b>PIV 1800-3100</b> |                |                          |

When designing this bullet, I envisioned a good tough bullet for the 338-06 that would still allow good velocities for a better trajectory. It would be good for the hunter with the 338-06 or the 338 Win. Mag that made the occasional trip out west for elk but whose normal quarry was in a class with deer, hogs, caribou, etc. Most people choose the heavier weights in the 338 so few reports have come back on the 338-200. All of them have reported complete pass-through on elk, so maybe; again, I might be being a little conservative. Not discounting the reports, if asked my opinion, I would still recommend the 338-225 for the hunter whose primary quarry was elk sized animals.

No Pictures are available at this time but performance is similar to the 338-225.
