Kitchen appliances

Kitchen Appliances Integration
Kitchen appliances such as dishwashers, refrigerators, ovens, and similar built-in units may be installed within designated cabinet compartments. The installer is responsible for verifying that the appliance dimensions, ventilation requirements, and installation clearances are compatible with the cabinet's maximum allowable dimensions before installation.

Any required openings for water supply, drainage, electrical connections, ventilation, or utility routing must be created by the installer based on the appliance manufacturer's specifications.
All plumbing and electrical installations shall be carried out in accordance with applicable local regulations and standards.

Where applicable, the supplied cabinet door/front panel may be mounted directly onto the appliance using the appliance manufacturer's fixing system and installation instructions. Proper alignment and adjustment of the front panel are required to ensure correct operation of both the appliance and the cabinet assembly.

Failure to verify appliance compatibility, installation clearances, and service connections may result in impaired functionality or damage to the cabinet and appliance.
